Exercise 8.15

If $\mathbf{x} \in \mathbb{R}^n$ is feasible for the primal and $\mathbf{y} \in \mathbb{R}^m$ is feasible for the dual, then $\mathbf{c}^T \mathbf{x} \leq \mathbf{b}^T \mathbf{y}$. *Proof:*

Let $\mathbf{x} \in \mathbb{R}^n$ be feasible for the primal and $\mathbf{y} \in \mathbb{R}^m$ be feasible for the dual. Then we know that $A\mathbf{x} \leq \mathbf{b}$ and $A^T\mathbf{y} \leq \mathbf{c}$, so

$$A\mathbf{x} \leq \mathbf{b}$$
 $\mathbf{x}^T A^T \leq \mathbf{b}^T$
 $\mathbf{x}^T A^T \mathbf{y} \leq \mathbf{b}^T \mathbf{y}$
 $\mathbf{x}^T \mathbf{c} \leq \mathbf{b}^T \mathbf{y}$
 $\mathbf{c}^T \mathbf{x} \leq \mathbf{b}^T \mathbf{y}$

Exercise 8.17

For a linear optimization problem in standard form, the dual of the dual optimization problem is again the primal problem.

Proof:

Consider the primal problem:

maximize
$$\mathbf{c}^T \mathbf{x}$$

subject to $A\mathbf{x} \leq \mathbf{b}$
 $\mathbf{x} \succeq \mathbf{0}$

with the dual problem:

minimize
$$\mathbf{b}^T \mathbf{y}$$

subject to $A^T \mathbf{y} \succeq \mathbf{c}$
 $\mathbf{y} \succeq \mathbf{0}$

The dual in standard form becomes:

maximize
$$(-\mathbf{b}^T)\mathbf{y}$$

subject to $(-A)^T\mathbf{y} \leq -\mathbf{c}$
 $\mathbf{y} \succeq \mathbf{0}$

and the dual of the dual is:

minimize
$$(-\mathbf{c}^T)\mathbf{x}$$

subject to $((-A)^T)^T\mathbf{x} \succeq -\mathbf{b}$
 $\mathbf{x} \succeq \mathbf{0}$

In standard form, this is:

$$\begin{aligned} \text{maximize} & & \mathbf{c}^T \mathbf{x} \\ \text{subject to} & & A \mathbf{x} \leq \mathbf{b} \\ & & & \mathbf{x} \succeq \mathbf{0} \end{aligned}$$

which is the original primal problem.

Exercise 8.18

Primal:

maximize
$$x_1 + x_2$$

subject to $2x_1 + x_2 + w_1 = 3$
 $x_1 + 3x_2 + w_2 = 5$
 $2x_1 + 3x_2 + w_3 = 4$
 $x_1, x_2, w_1, w_2, w_3 \ge 0$

Optimal point: $(\frac{5}{4}, \frac{1}{2})$ Optimum value: $\frac{7}{4}$

Dual:

minimize
$$3y_1 + 5y_2 + 4y_3$$

subject to $2y_1 + y_2 + 2y_3 \ge 1$
 $y_1 + 3y_2 + 3y_3 \ge 1$
 $y_1 + 3y_2 + 3y_3 \ge 1$
 $y_1, y_2, y_3 \ge 0$

Dual in standard form:

maximize
$$-3y_1 - 5y_2 - 4y_3$$

subject to $-2y_1 - y_2 - 2y_3 + v_1 - v_0 = -1$
 $-y_1 - 3y_2 - 3y_3 + v_2 - v_0 = -1$
 $y_1, y_2, y_3, v_1, v_2 \ge 0$

Optimal point: $(\frac{1}{4}, 0, \frac{1}{4})$ Optimum value: $\frac{7}{4}$
